

Unprecedented ease of operation

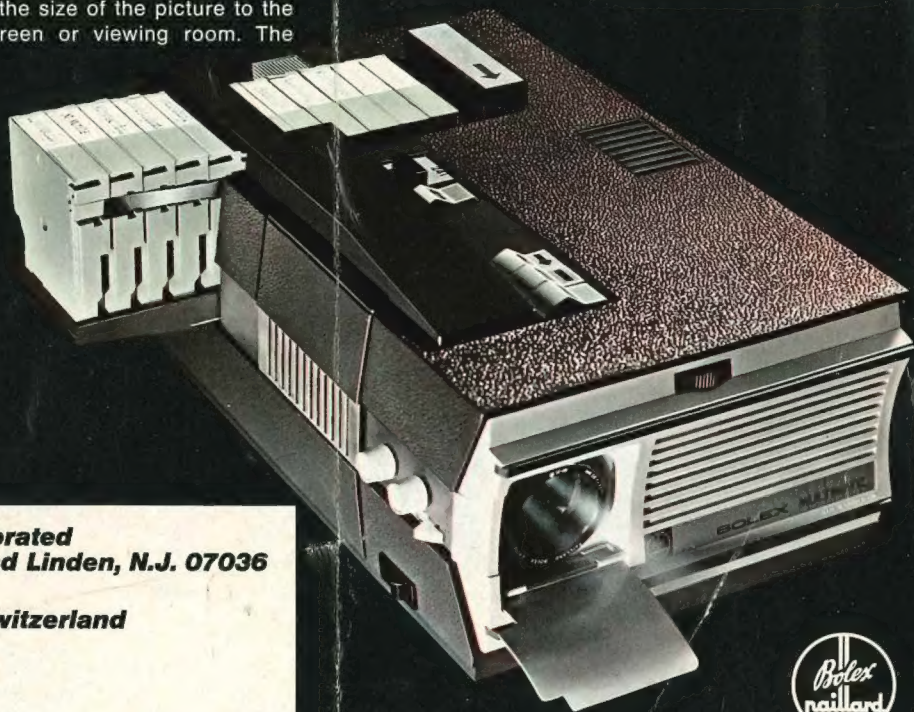

Just press a key to select any type of operation you please — speeds of 18 or 24 f.p.s., fascinating slow motion at 6 or 8 f.p.s., or single-frame projection — to study an expression or scene at leisure, or to "freeze" a movement on the screen. And, of course, there is always the delight of reverse projection.

Choose from four superb lenses, including two zooms offering maximum convenience by enabling you to instantly adapt the size of the picture to the dimensions of the screen or viewing room. The 21 V/150 W halogen lamp assures such brilliant pictures that it is unnecessary to have the room totally dark. As soon as you stop projection, a built-in intermission lamp provides discreet but adequate lighting. The Bolex Multimatic projector has been designed with your enjoyment in mind.

Super 8 Cartridge Film Projector

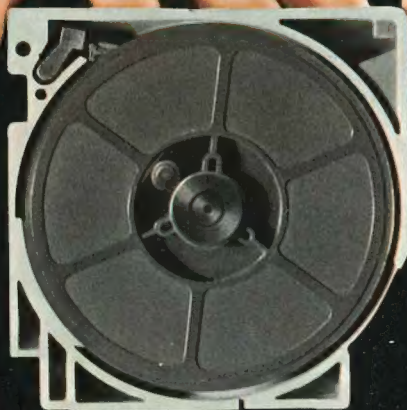

Box H-6 2/73 Bolex Multimatic

**Bolex
Multimatic**

Pleasure without problems. Projection the way you've always wished it could be! Suit your program and projection time to the mood of the moment and the tastes of your guests... the cocktail film show... the coffee film show... a modern way to entertain!

The key to radically simplified projection

The projection cartridge forms the nucleus of the new Bolex Multimatic system. Simply take the developed spool of Super 8 film and slip it, once and for all, into the Bolex cartridge. Your film is now ready for immediate projection, without any further preparation. At the speed of 18 frames per second, it will provide over 3 minutes viewing.

From the time you shoot to the time you project, your precious film has never to be touched. Entirely automatic, this brilliant new Bolex system offers you utmost simplicity and reliability.

From 3 minutes ad infinitum! Non-stop projection if you wish

The Bolex Multimatic accepts several cartridges at a time and projects them automatically, one after the other. Insert one, two, three... up to six cartridges in the projector at the same time, press a key and projection begins with the first three-minute film. At the end of the first cartridge the second will move into place. And while the second film is projected, the first will automatically rewind into cartridge No. 1. And so it goes, cartridge after cartridge. What happens when you come to the last film? You simply insert a fresh supply of cartridges into the projector while the last film of the first group continues to flash on the screen. Projection can continue without interruption, ad infinitum. Composed of three-minute sections, your programs can be as short or as long as you like!

Designed for maximum convenience

The Bolex Multimatic projector can be a permanent fixture in your living room. Keep it on a bookshelf, for example, and project from there. The projection lamp is so powerful that the room only has to be semi-darkened. You can look after your guests during projection and keep the atmosphere relaxed and easy. No more dozing, or groping around in the dark! The amazing "multicartridge" Bolex Multimatic makes projection more comfortable and convenient than ever before.
